

# **Native Protocol Transactional Gateway**

## **Market Maker Interface**

System version 1.7

Interface version 22

Document version 1.2.0

27 February 2018

# Revision history

## Version 1.2.0 15 February 2018

1. Terminology is changed.
2. Error codes was added.

## Version 1.1.7 3 April 2017

Values Day and XH of field time\_in\_force is corrected in messages [AddOrder](#) and [AddReport](#).

## Version 1.1.0 22 September 2016

1. New value X of field TimeInForce is added to messages [AddOrder](#) and [AddReport](#).
2. New values 1030, 1031, 1032, 1033 of field ExchangeSpecialInstructions is added to messages [AddOrder](#) and [AddReport](#).

| 35. Format of message CounterDeclineReport: msgid=208, size=94 ..... | 35 |

# 1. Trading system overview

The trading system is designed to allow users to perform operations on financial markets. The main functions include:

1. Acceptance of orders submitted to over-the-counter and exchange markets.
2. Routing and placing of orders in available liquidity pools.
3. Registration of trades and processing of information on trades at liquidity pools.
4. Transmission of anonymous market data, collected from all liquidity pools, and non-anonymous market data as well as additional and reference data.
5. Control of clearing member's risks on operations with instruments registered in the system.
6. Other functionality for access to trading.

## 1.1. Instruments of trading system

The Instruments are divided into **exchange** and **over-the-counter (OTC)**. OTC instruments have the following attributes:

- Field `section` in `Instruments` messages has value **OTC**.
- Field `over_the_counter` in `TradeModes` messages has value **1**.
- Field `flags` has value **0x400000** (`eOverTheCounter`).

Table 1. Differences in the interpretation of messages fields

| Instrument       | Value of <code>order_id</code> field | Value of <code>deal_id</code> field |
|------------------|--------------------------------------|-------------------------------------|
| Exchange         | Order ID                             | Trade ID                            |
| Over-the-counter | Tender ID                            | Contract ID                         |

All instruments of trading system are available for trades.

## 1.2. Trading modes

### 1.2.1. Main trades mode

In the main trades mode anonymous orders are executed at liquidity pools.

The Main trades mode supports five order types. The order type is determined by the set of field values in the message.

#### 1.2.1.1. Order types

1. Market order that will execute at the best available prices until it is fully filled; any remainder will be expired.
2. Day limit order that will execute at the specified or better price; the remainder, if any, is added to the order book and will be active till the end of the trading day.
3. Extended session limit order that will execute at the specified or better price; the remainder, if any, is added to the order book and will be active till the end of the extended trading session.
4. Fill or Kill (FOK) order that will execute immediately and completely, or canceled. This is an order with specified price and volume.
5. Immediate or Cancel (IOC) order that execute immediately, completely or partially, or canceled. This is an order with specified price and volume.

The set of order types available in the trading system may differ from the set of orders supported by a specific liquidity pool.

*Iceberg order is not supported in the current system version.*

### 1.2.1.2. Execution of orders

For a group of instruments listed on the trading system, the **Main pool** is determined among several liquidity pools by the highest liquidity level. The Main liquidity pool status may influence the choice of routing strategy: by default the volume that cannot be matched against active orders in the order book will be routed to that pool.

A client order, submitted to the trading system, can be executed at liquidity pools where the indicated instrument is admitted to trading. If there is only one liquidity pool matching this criterion, the entire orders volume is routed to that pool. If there are several liquidity pools like that, the order will be executed in accordance with the best execution principles.

In the course of routing, the incoming order is consecutively matched with counter orders at each price level until the order volume is filled. If all the available price levels were checked and the incoming order has not been filled completely, the remaining volume is routed to the Main liquidity pool. After the volumes to be routed are determined, they are sent to the liquidity pools.

Routing of client order depends on the order type.

A Fill Or Kill order can be filled at one liquidity pool only, where the order initiator can get the best average weighted price; in case of several equal prices the trading system give the priority to the pool providing a lower latency.

An incoming order of other types (limit, market, Immediate Or Cancel) can be routed to several liquidity pools. For each price level consecutively, starting from the best one for the order initiator, the volume to be executed is determined on each available pool. After the volumes to be routed are determined, they are sent to the appropriate price levels to the liquidity pools.

### 1.2.2. Negotiated trades mode

The Negotiated trades mode supports negotiated orders with fully matching parameters. Negotiated order is an order with an indication of price, volume, initiator and counterparty. The counterparty is notified that order is submitted on its clearing account (for detail on interaction with trading gateway refer to section [2](#)).

### 1.2.3. Negotiated repo trades mode

Price of order for repo trades is indicated in annual interest rate. In additional price field the client can indicate the price of the first-leg instrument. If client did not indicate a price, the additional price will be settled or will be indicated by the liquidity pool.

Repo trading instrument has three legs (balance instruments):

1. Change in the obligation to deliver securities under the first part of repo trade.
2. Change in the obligation to deliver currency under the first part of repo trade.
3. Change in the obligation to deliver securities under the second part of repo trade.

Currency obligation under the second part of repo trade is changed using the price setting tool for repo trading instrument.

### 1.2.4. Closing Auction in the Foreign Securities Market

The Closing Auction in the Foreign Securities Market supports only market order with time in force - closing auction. Trades are executed at the official closing price of the instrument of the liquidity pool, on which the security was listed. Orders, leading to cross trade, will be automatically canceled by the liquidity pool.

Trading in the Closing Auction:

1. During the trading day, clients submit market orders in the trading system.
2. Submission of orders is stopped according to the approved schedule of trading and orders become unavailable to cancel.
3. Closing auction is held — counterorders, sorted by ascending of the time of submission, are matched together at instrument's closing price at Main liquidity pool.
4. Remainders of orders and unfilled orders are canceled.

## 2. Message flow

### 2.1. Order submission

The client submits a new order by sending the `AddOrder` message to the trading system. For each order, the client should provide the client identifier `clorder_id` unique for a login across a trading day.

After accepting the request, the trading system returns `AddReport` to the client with the `order_id` assigned. If the system rejects the request (due to an invalid value or a closed market), the order identifier will not be provided and the client will receive `RejectReport`.

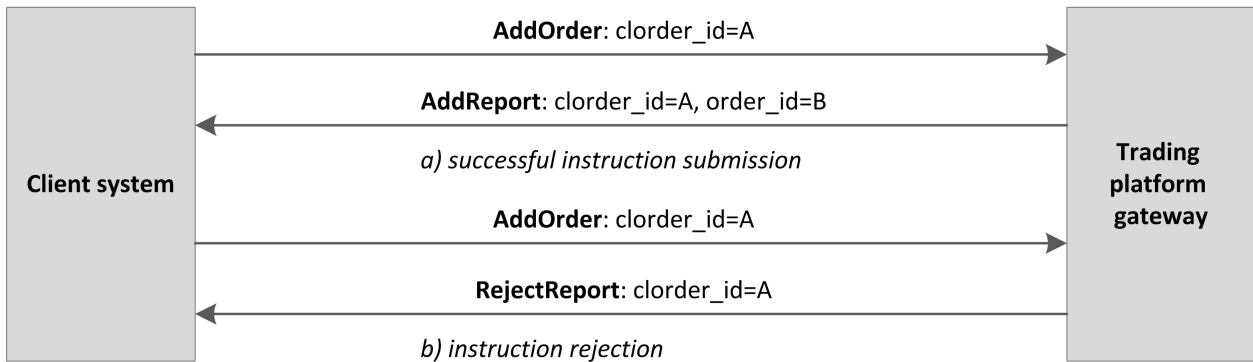

Figure 1. Order submission

#### 2.1.1. Order placement

To ensure best execution, the order volume is split according to the current state of the order book and then it is routed to liquidity pools. After the liquidity pool reports successful routing, the gateway will send `AddReport` to the client with the `exch_orderid` assigned.

If the liquidity pool reports unsuccessful routing, the trading system will return `RejectReport` to the client, and will cancel a portion of the order that equals to the rejected volume and will notify the client with the `CancelReport`.

A Fill Or Kill order can be routed to one liquidity pool only. If the pool reports successful routing, the gateway will send reports as described above. If the pool reports unsuccessful routing, the trading system will return `RejectReport` to the client, and will cancel the order and will notify the client with the `CancelReport`.

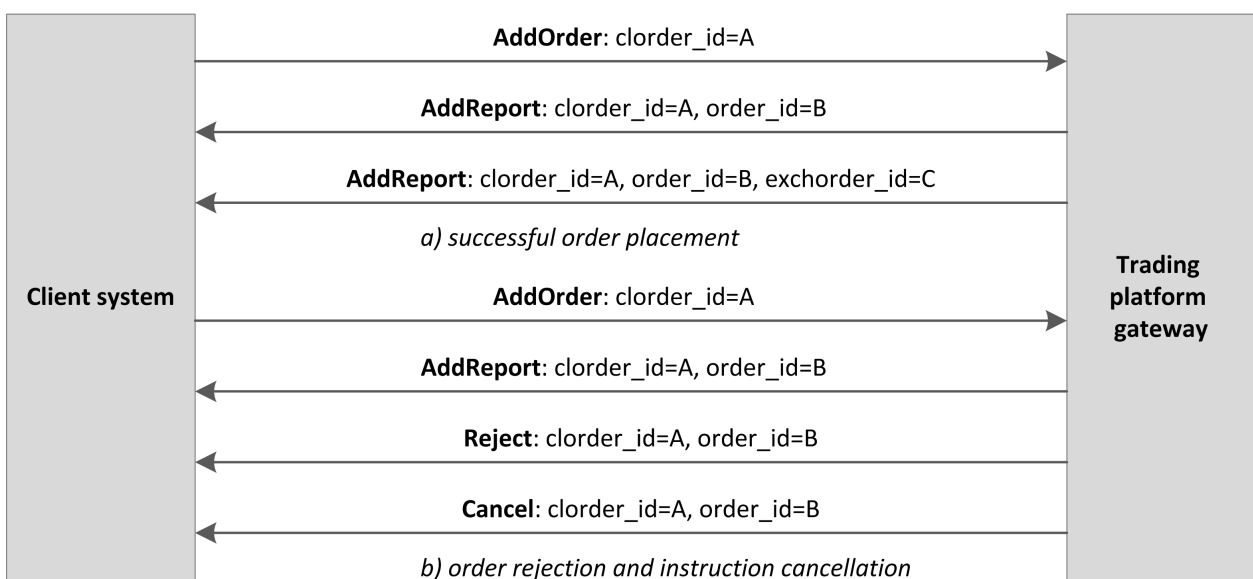

Figure 2. Order placement or rejection

## 2.2. Order execution

After the liquidity pool accepts an order, the client will receive `Execution` reports as soon as a trade is done. Trades done within a single transaction, i.e. a sequence of concurrent trades of an incoming order, are included in one or more consequential reports with the active remainder after all the trades in the `amount_rest` field and the trades information in the `deals` group.

The order Execution report will follow the order reports and contain the same `deals` group.

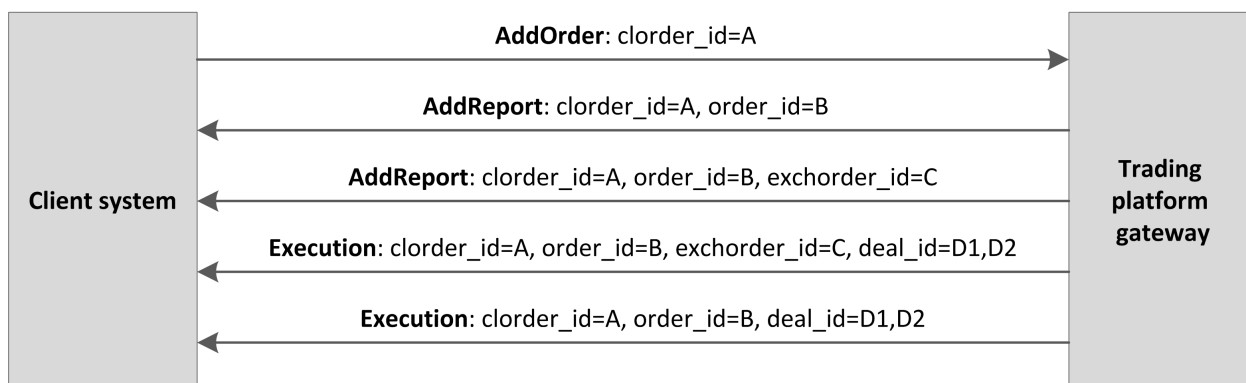

Figure 3. Order submission and execution

## 2.3. Remainder cancellation after order execution

Under some conditions, a liquidity pool cancels an order remainder, e.g. unfilled portion of a market or IOC order, or to prevent a cross trade. In this case a client will receive the `CancelReport` about full or partial cancellation after the `AddReports` and `Execution` reports.

Moreover, to ensure best execution, the trading system may cancel an order at a liquidity pool and place it to another. Then, the client should also expect a `CancelReport` after an `AddOrder` or `Execution` report.

## 2.4. Order cancellation

*The routed order can be canceled only in full volume. The part of the order cannot be canceled.*

The client can cancel an active remainder of an order. To request an order cancellation the client should send the `CancelOrder` message to the server with an order identifier specified.

When the order successfully cancelled, the client will receive the following `CancelReports` — reports on orders cancellation and then report on order cancellation.

If the trading system expects a response from the liquidity pool for a considerable time, the client will receive `RejectReport` with `Pending cancel` in the message field.

If an order cannot be cancelled or the request originator does not have permissions, the request will be rejected with `RejectReport`.

## Message flow

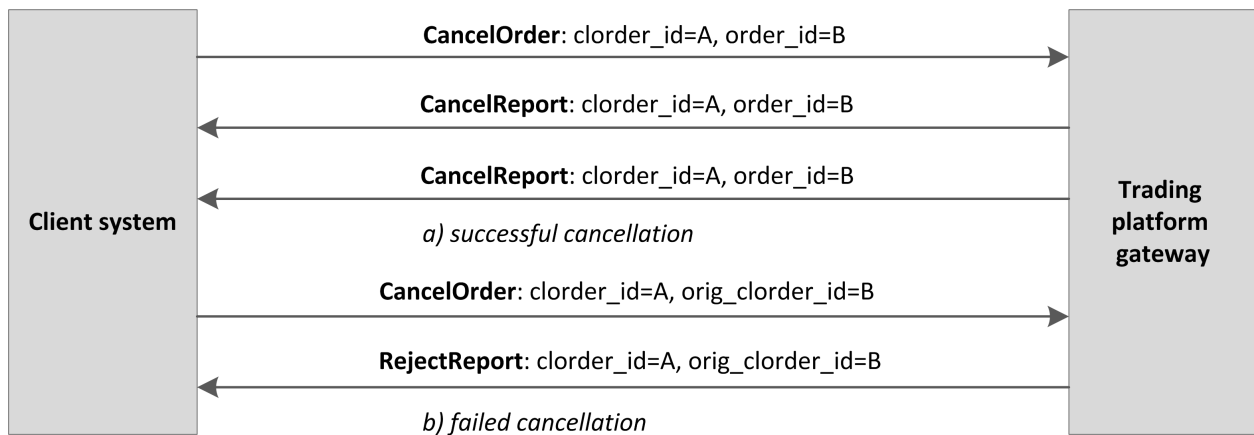

Figure 4. Order cancellation

## 2.5. Mass order cancellation

The client can cancel a set of orders selected by a specific parameter: an instrument, a user, etc. To cancel a set of orders, client should send the `MassCancel` request with specified cancellation mode and, if relevant, order parameters.

The trading system receives the request and selects orders to cancel by the defined criteria, and then generates cancel requests and routes them to liquidity pools. If the orders are successfully cancelled, the gateway will send `CancelReport` reports on each order cancellation. The number of cancelled orders is specified in the `MassCancelReport` message that notifies of the request completion. If no order to cancel is found, the gateway will only return `MassCancelReport`.

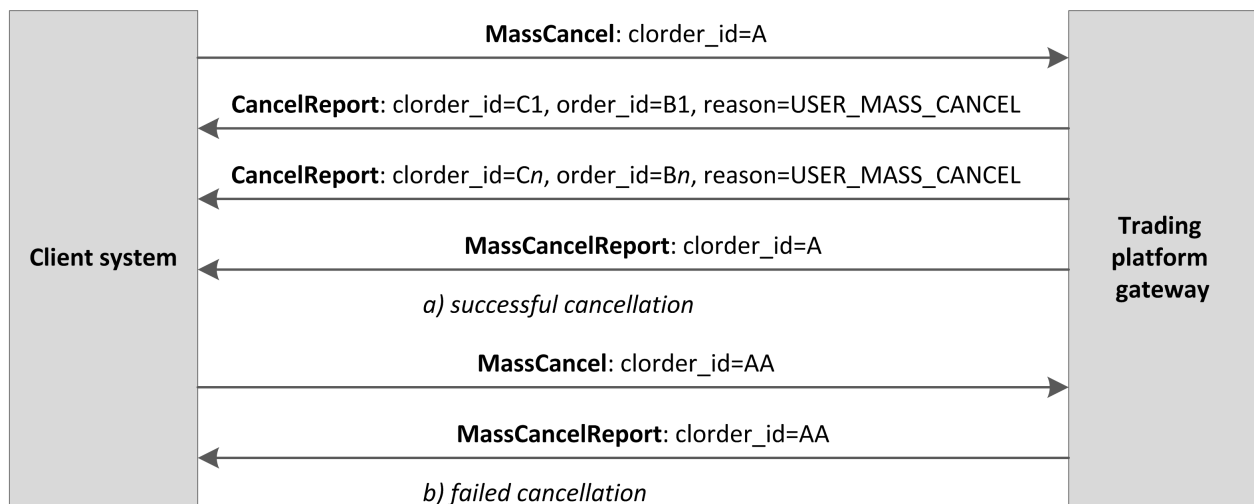

Figure 5. Order mass cancellation

## 2.6. Negotiated order submission, execution and rejection

The client submits a negotiated order via the `AddOrder` message with `type=NEGOTIATED`. A negotiated order should contain the `initiator_party` identifier of the order initiator and the counterparty identifier `ctrparty_id`. The initiator may enter an identifier for order matching in the `match_ref` field.

Similar to an anonymous order described above, the client will receive `AddReport` when the trading system accepts a negotiated order and then the liquidity pool accepts the order, or a `RejectReport`, if the system rejects the order (for more details please refer to section 2.1).

After the order acceptance, the trading system will notify the counterparty with `CounterReport`.

Until the counterparty submits the counterorder, the initiator can cancel the order by sending the `CancelOrder` request to the gateway with any order identifier specified. When the order is cancelled, the trading system will send `CancelReport` to the order initiator and `CounterUpdateReport` to the counterparty.

## Message flow

Figure 6. Negotiated order placement and cancellation

### 2.6.1. Counterorder placement

To close a trade, the counterparty should submit an order of the same instrument and quantity at the same price with the switched direction and counterparties.

Figure 7. Counterorder placement

If the price, quantity, instrument, order direction or counterparties of counter and original order mismatch, then the counterorder will be placed as a new one.

### 2.6.2. Negotiated order decline

The counterparty can decline an active negotiated order by sending the `CounterDecline` request to the gateway.

When the order is cancelled, the trading system will send `CounterDeclineReport` (first, with `source_id=1000`, then with `source_id=1001`) and `CounterUpdateReport` to the `CounterDecline` request originator and `CancelReport` to the order initiator.

If an order cannot be cancelled, the request will be rejected with `RejectReport`.

Figure 8. Counterorder decline

## 3. Native protocol specification

### 3.1. Datatypes

The trading system uses little-endian byte order (same as in x86 processor); the client shall use same.

`asciiN` is an alphanumeric string of  $N$ -byte length; the unused part should be filled with zero bytes.

`charN+1` is a UTF-8 encoded string of  $N+1$ -byte length. The last byte is the end of line character and so the available length is  $N$ ; the unused part should be filled with zero bytes.

`dec2` is an eight-byte integer representing a fraction multiplied by  $10^2$ .

`dec8` is an eight-byte integer representing a fraction multiplied by  $10^8$ .

`decn` is a nine-byte sequence; the first eight bytes are an integer representing a fraction multiplied by  $10^n$  and the last byte is  $n$ . Its value should be within the range from 0 to 8.

`intN` is an  $N$ -byte integer.

`time4` is a four-byte integer representing the Unix time in seconds, i.e. the number of seconds since 1 January 1970.

`time8n` is an eight-byte integer representing the Unix time in nanoseconds, i.e. the number of nanoseconds since 1 January 1970.

`time8m` is an eight-byte integer representing the Unix time in milliseconds, i.e. the number of milliseconds since 1 January 1970. If a field of this datatype conveys a date, the value part representing hours, minutes, seconds and milliseconds should be neglected, i.e. that is to use an integer value (rounded down) of division by 86 400 000.

### 3.2. Discovery service

The Discovery service provides a host address for client connections to the trading system gateway. The client should request the service for address allocation each time before connecting to the gateway. Upon receipt of response, the client should disconnect from the login server and connect to a gateway through the received address.

For the address for accessing the Discovery service please refer to *Network Connectivity*.

After establishing connection with the Discovery service, the client should send the `Hello` message. The IP address of the client must be authorized for the specified login (user ID); otherwise, the connection request will be rejected. The message contains the session header `frame` (for more details refer to section 3.7.1).

Table 2. Format of request `Hello`: `msgid=1, size=32, seq=0`

| Offset | Field    | Datatype | Description    |
|--------|----------|----------|----------------|
|        | [frame]  | [frame]  | Session header |
| 0      | login    | ascii16  | Login          |
| 16     | password | ascii16  | Password       |

In response to request, the server sends the `Report` message. If this message has `status=0`, the message contains repetitive group `addresses`; the number of group records will be specified in the field `addresses_count` (for more details on processing of repeating groups please see section 3.6). The group includes fields `type` (gateway attribute) and `addresses` (host address and gateway port). Gateway attributes may combine.

For some time after the trading system response, the gateway will expect the client's login connection to the specified address. In case of failure, the client should make two additional connection attempts with an interval of half a second. If the login is invalid or blocked, the server response will contain `status=1`.

Table 3. Format of response `Report`: `msgid=2, seq=0, dynamic length`

| Offset | Field   | Datatype | Description    |
|--------|---------|----------|----------------|
|        | [frame] | [frame]  | Session header |

| Offset | Field            | Datatype                    | Description  |
|--------|------------------|-----------------------------|--|
| 0      | status           | int2                        | Request status. Values: <ul style="list-style-type: none"> <li>• 0 (success),</li> <li>• 1 (reject due to invalid login/password)</li> </ul> |
| 2      | reason           | char127+1                   | Textual description  |
| 130    | addresses_offset | int2                        | Offset of the first underlying entry from the beginning of this field. Value: 4  |
| 132    | addresses_count  | int2                        | Number of <code>addresses</code> group entries   |
|        | > [addresses]    | <a href="#">[addresses]</a> | Addresses list   |

Table 4. Format of component `addresses`: size 52 bytes

| Field   | Datatype | Description  |
|---------|----------|--|
| type    | int2     | Gateway attributes, bit mask. Values: <ul style="list-style-type: none"> <li>• 0x0 (No);</li> <li>• 0x1 (Trading);</li> <li>• 0x2 (Drop copy);</li> <li>• 0x4 (Risk management);</li> <li>• 0x8 (Dictionaries);</li> <li>• 0x10 (Market data);</li> <li>• 0x4000 (Backup)</li> </ul> |
| ver     | int1     | Protocol version   |
| pad0    | int1     | Reserved field, filled with zero bytes   |
| address | char47+1 | Address of host and gateway port   |

### 3.3. Format of components

Table 5. Format of component `user_header`: length 20 bytes

| Field      | Datatype | Description     |
|------------|----------|-----------------|
| clorder_id | ascii20  | Client order ID |

Table 6. Format of component `gate_header`: length 46 bytes

| Field       | Datatype | Description  |
|-------------|----------|--|
| system_time | time8n   | Client request processing time   |
| source_id   | int2     | Message source (for values please refer to section <a href="#">3.4</a> ) |
| clorder_id  | ascii20  | Client order ID  |
| user_id     | ascii16  | Login, client gateway ID   |

Field `user_id` can be empty, for example if order is automatically canceled by trading system.

Table 7. Format of component `instrument`: length 6 bytes

| Field                      | Datatype | Description  |
|----------------------------|----------|--|
| <code>market_id</code>     | int2     | Liquidity pool ID (please refer to section <a href="#">3.5</a> ) |
| <code>instrument_id</code> | int4     | Trading instrument ID  |

Table 8. Format of component `account`: length 36 bytes

| Field                  | Datatype | Description         |
|------------------------|----------|---------------------|
| <code>member_id</code> | int4     | Trading member ID   |
| <code>account</code>   | ascii16  | Clearing account ID |
| <code>client_id</code> | ascii16  | Client code ID      |

Table 9. Format of component `deal`: length 20 bytes

| Field                   | Datatype | Description                         |
|-------------------------|----------|-------------------------------------|
| <code>deal_price</code> | dec8     | Trade price                         |
| <code>deal_id</code>    | int8     | Trade ID assigned by liquidity pool |
| <code>amount</code>     | int4     | Trade volume                        |

Table 10. Format of component `otccodes`: length 32 bytes

| Field                        | Datatype | Description                   |
|------------------------------|----------|-------------------------------|
| <code>initiator_party</code> | ascii16  | Negotiated order sender ID    |
| <code>ctrparty</code>        | ascii16  | Negotiated order recipient ID |

### 3.4. Values `source_id`

Field `source_id` is in the header `gate_header`; the field specifies the module transmitting message to gateway for sending it to client.

Table 11. Values `source_id` to be returned to client

| Range     | Description  |
|-----------|--|
| 100–199   | Trading system gateway                               |
| 200–249   | Clearing House risk parameter verification modules   |
| 250–259   | Matching modules                                     |
| 300–499   | Modules of generation and calculation of market data |
| 500–549   | Routing modules                                      |
| 1000–1099 | Liquidity pool identifiers                           |

### 3.5. Liquidity pool identifiers

Liquidity pools' identifiers may be in fields `source_id`, `market` and `exec_market`.

- 0 (DEFAULT) — liquidity pool is defined by the trading system.
- 1001 (TRADSYS) — all available liquidity pools.
- 1000 — liquidity pool of Saint-Petersburg Exchange.
- 1010 — liquidity pool of Moscow Exchange.
- 1015 — execution at United States liquidity pools.
- 1016 — market data from United States liquidity pools.
- 1030 — liquidity pool of NYSE.
- 1031 — liquidity pool of ARCA.
- 1032 — liquidity pool of NASDAQ.
- 1033 — liquidity pool of BATS.

### 3.6. Processing messages with repetitive components and fields

Several message types contain one or more repeating groups or fields which may have an arbitrary number of entries. One message may include multiple repetitive components and fields. All same-type repetitive components has a constant length.

A repeating component or field is always preceded by the two fields—*offset* and *count*. The *count* field specifies the number of group entries. The *offset* field indicates an offset in bytes of first entry of the group from the beginning of this very field; its value is no less than 4.

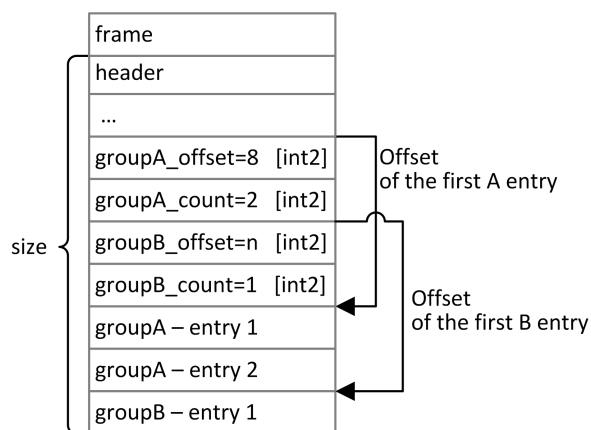

Figure 9. Template of a message with two repeating components

A repeating component may include another repeating component or field. Then each entry refers to its own set of the embedded component entries.

Figure 10. Template of embedded components

## 3.7. General session layer

### 3.7.1. Message generation and transmission

A native protocol message is a sequence of field values in a strict order. Any message starts with the `frame` header; this three-field component includes message size, sequence number, and message type. The message size is the length of the whole message, except for the frame header, in bytes. The size is constant for a message type which does not include any repeating group.

A message is transmitted in a network packet as a sequence of bytes.

Table 12. Format of component `frame`: length 12 bytes

| Field | Datatype | Description  |
|-------|----------|--|
| size  | int2     | Message length in bytes, excluding the <code>frame</code> header |
| msgid | int2     | Message type   |
| seq   | int8     | Application message sequence number                              |

### 3.7.2. Session initialization

A session is established over a network connection between the client's system and the gateway of the trading system.

Once connection is established, the client can send the `Login` message to initiate a session. The message includes the user ID and the password. The server validates the authentication parameters and answers with the `Logon` message and so the session is active. Upon receipt of a malformed `Login` message or invalid login/password, the server breaks the connection.

A login may have a single concurrent session. If the server detects a second connection attempt via the same login while a valid session is already underway, the server will respond with `Reject`.

Table 13. Format of message `Login`: msgid=8001, size=37

| Offset | Field        | Datatype | Description   |
|--------|--------------|----------|---|
|        | [frame]      | [frame]  | Session header  |
| 0      | login        | ascii16  | Login   |
| 16     | password     | ascii16  | Password  |
| 32     | reset_seq    | int1     | Reset sequence numbers indicator. Values: <ul style="list-style-type: none"> <li>0 (no): sequence numbers continue;</li> <li>1 (yes): sequence numbers reset</li> </ul> |
| 33     | heartbeat_ms | int4     | Heartbeat frequency in milliseconds   |

Table 14. Format of message `Logon`: msgid=8101, size=24

| Offset | Field        | Datatype | Description   |
|--------|--------------|----------|---|
|        | [frame]      | [frame]  | Session header  |
| 0      | last_seq     | int8     | Last application message available to client. If altered from the last received message, <code>ResendRequest</code> is to be sent |
| 8      | expected_seq | int8     | Next application message expected from client   |
| 16     | system_id    | ascii8   | Deployment ID   |

### 3.7.3. Heartbeats

The client and the gateway exchange `Heartbeat` messages to monitor the connection status. Heartbeat is sent, if no session or application message has been sent within the heartbeat interval.

When initiating a session, the client sets the heartbeat interval in the field `heartbeat_ms` of the `Login` message.

If the server detects inactivity for a period longer than the specified interval, the server will break the connection. The client is expected to do the same, if inactivity is detected on the part of the server.

Table 15. Format of message `HeartBeat`: `msgid=8103`, `size=0`

| Offset | Field   | Datatype | Description    |
|--------|---------|----------|----------------|
|        | [frame] | [frame]  | Session header |

### 3.7.4. Message numbers

All application messages have a unique number throughout the trading day. Messages by each session side (the client and the gateway) are sequentially numbered with positive integers starting with 1. This allows to request and resend messages lost in case of unexpected disconnection.

Sequence numbers are not assigned to session messages—the `seq` value is always 0.

In order to maintain sequential numbering of messages, at session initialization the gateway provides two key values in its `Logon` message—the number of the last message sent (`last_seq`) and the expected number of the following message (`expected_seq`).

The gateway accumulates messages addressed to the client even when no connection established. If the `last_seq` field is greater than the last message received during the previous session, the client should request not received messages via the `ResendRequest`.

If the message number differs from the expected one, the gateway terminates the connection. After disconnection, the client should reconnect by addressing the `Discovery` service and restore the number of messages according to the values obtained in the `Logon` message from the gateway. The gateway never initiates a change in numbering when receiving a message with the number higher than expected.

The trading system supports continuous message numbering between trading sessions, including trading days. The client should set `reset_seq=1` in message `Login` at session initialization to reset numbering.

### 3.7.5. Message sequence number reset

The client may change the number of expected message at the gateway. For this purpose, the client should send `SequenceReset` specifying next message number in the `next_seq` field. At that, the new number shall not be less than the current value at the gateway.

Table 16. Format of message `SequenceReset`: `msgid=8004`, `size=8`

| Offset | Field                 | Datatype          | Description                               |
|--------|-----------------------|-------------------|---|
|        | [frame]               | [frame]           | Session header                            |
| 0      | <code>next_seq</code> | <code>int8</code> | Next sequence number expected from client |

### 3.7.6. Message resend request

If the client receives from the server a message with the number higher than expected, the client should either reset the counter or request missing messages from the server by `ResendRequest`.

Messages sent during the current and previous trading days are available for client resend requests. If the client forcefully resets message numbering (`reset_seq=1` in `Login`), a request for resending messages sent prior to this reset is not possible.

The `ResendRequest` must specify the first message within requested messages range (`from_seq`) and the last message (`till_seq`). If the client uses `from_seq=0` and `till_seq=0`, the gateway will resend messages starting from the lowest

number available. If the client uses field `till_seq=0`, the server will resend all messages of the current trading session starting from the number specified in field `from_seq`. All possible cases are listed hereinafter:

1. `from_seq=n, till_seq=m` (request for messages from  $n$  to  $m$ ),
2. `from_seq=0, till_seq=n` (request for messages from the lowest number available to  $n$ ),
3. `from_seq=n, till_seq=0` (request for messages from  $n$  to the last number available but not exceeding the maximum available number),
4. `from_seq=0, till_seq=0` (request for all available messages but not exceeding the maximum available number).
5. `from_seq=-1, till_seq=0` (request for all available messages for the current trading day but not exceeding the maximum available number).
6. `from_seq=-2, till_seq=0` (request for all available messages for the previous and current trading days but not exceeding the maximum available number; if messages for one of the trading days are not available, the trading system will return an error).

It is recommended to use the query `from_seq=0, till_seq=0` at the first connection after a long break. If after re-sending, the gateway returns `ResendReport` with the `MORE` status, the client should send another request specifying `from_seq` with the number following the last resent message and `till_seq=0`.

The number range for requested messages is not limitless (for more details please refer to *Network Connectivity*). If requiring more messages, the client should send several consecutive requests. Any new request sent prior to the resend completion is to be rejected by the gateway with `ResendReport` indicating the `DUPLICATE_REQUEST` status. If the query is `till_seq=0`, the gateway is to transmit messages not exceeding its maximum number.

Table 17. Format of message `ResendRequest`: `msgid=8005, size=16`

| Offset | Field                 | Datatype | Description             |
|--------|-----------------------|----------|-------------------------|
|        | [frame]               | [frame]  | Session header          |
| 0      | <code>from_seq</code> | int8     | First requested message |
| 8      | <code>till_seq</code> | int8     | Last requested message  |

In response to correct request, the trading system will transmit `ResendReport` indicating the `ACK` status and requested messages. Upon completion of transmission, the gateway will send `ResendReport` conveying `MORE` or `FINISH`. The status `MORE` indicates that the number of the last message within the range is less than the number of the last trading message sent by the gateway; that is, there are messages of application level not included in the request and they could have been generated during the request execution.

While resending, the server may also transmit new trading messages, so client should also expect message with a number exceeding the requested range.

Table 18. Format of message `ResendReport`: `msgid=8105, size=2`

| Offset | Field               | Datatype | Description  |
|--------|---------------------|----------|--|
|        | [frame]             | [frame]  | Session header   |
| 0      | <code>status</code> | int2     | Request status. Values: <ul style="list-style-type: none"> <li>• 0 (ACK): gateway is ready to respond to a request;</li> <li>• 1 (MORE): gateway executed the query and still has data for client;</li> <li>• 2 (FINISH): all available data sent to the client;</li> <li>• 3 (DUPLICATE_REQUEST): server busy with the previous <code>ResendRequest</code>;</li> <li>• 4 (UNAVAILABLE): recovery service unavailable</li> </ul> |

### 3.7.7. Session termination

The server or the client sends `Logout` to terminate the session and expects the other party to disconnect.

Table 19. Format of message `Logout`: `msgid=8002`, `size=16`

| Offset | Field   | Datatype | Description              |
|--------|---------|----------|--------------------------|
|        | [frame] | [frame]  | Session header           |
| 0      | login   | ascii16  | Login, client gateway ID |

### 3.7.8. Message rejection

If the client's message is either malformed or contains invalid values, the server rejects such message and responds with `Reject`. The `ref_msgid` field specifies message type, `ref_seq` contains the application level message number or has 0 for session message, fields `reason` and `message` contain, correspondingly, code of rejection reason and its description.

Table 20. Format of message `Reject`: `msgid=8102`, `size=45`

| Offset | Field     | Datatype | Description                                 |
|--------|-----------|----------|---|
|        | [frame]   | [frame]  | Session header                              |
| 0      | ref_seq   | int8     | Sequence number of rejected message         |
| 8      | ref_msgid | int2     | Type of rejected message                    |
| 10     | reason    | int2     | Code of rejection reason                    |
| 12     | message   | char32+1 | Rejection parameters or textual description |

### 3.7.9. Disconnection

Server disconnects when receiving message:

- with unknown value of `msgid`,
- with a `size` incorrect for the specified message type,
- with a `seq` number other than expected.

## 3.8. Application level

### 3.8.1. Client requests

#### 3.8.1.1. New order

The client submits a new order by sending the message `AddOrder` that should contains:

- trading instrument ID in the `instrument_id` field (for details refer to *Instrument reference data* document),
- routing options in the `routing_dest`, `market`, `prime_exchange` and `routing_instruction` fields,
- side in the `dir` field,
- volume of order in the `amount` field,
- clearing account ID in the `account` and `client_id` fields.

The `price` should be specified for all order types, except for market (`type=MARKET`), and should be entered as an integer with eight implied decimal places, e.g. 123,45 is to be rendered as 1234500000. The price is an integer multiple of the step price (refer to *Instrument reference data*).

Each order type is characterized by its own applicable fields and field values.

Table 21. Order types

| Order type                              | Applicable fields                         |
|---|---|
| Market                                  | type=MARKET, time_in_force=IOC            |
| Market order at closing auction         | type=MARKET, time_in_force=OC             |
| Limit order at closing auction          | type=LIMIT, time_in_force=OC, price       |
| Day active limit                        | type=LIMIT, time_in_force=Day, price      |
| Limit order in extended trading session | type=LIMIT, time_in_force=XH, price       |
| Fill or Kill (FOK)                      | type=LIMIT, time_in_force=FOK, price      |
| Immediate or Cancel (IOC)               | type=LIMIT, time_in_force=IOC, price      |
| Negotiated                              | type=NEGOTIATED, time_in_force=Day, price |

The client should provide a new order with a client order ID (`clorder_id`) which has to be unique for a user across a trading day.

An order is considered as a negotiated order if the counterparts identifiers (`initiator_party` and `ctrparty_id`) are specified. The order initiator may enter a `match_ref`, and the counterparty will have to use the same value, otherwise the two orders will not match.

After processing a message, the trading system either rejects the message with `RejectReport` or confirms the acceptance with `AddReport`.

The client may provide a `comment` (a 23 byte string in UTF-8).

At the end of a trading session or extended trading session, all active orders (`time_in_force=Day` or `time_in_force=XH`) will be cancelled and the client will receive `CancelReport` with the `cancel_reason=EXPIRED`.

Table 22. Format of message `AddOrder`: `msgid=101`, `size=194`

| Offset | Field         | Datatype      | Description   |
|--------|---------------|---------------|---|
|        | [frame]       | [frame]       | Session header  |
| 0      | [user_header] | [user_header] | Standard header   |
| 20     | instrument    | [instrument]  | Component specifying trading instrument   |
| 26     | dir           | int1          | Side. Values: <ul style="list-style-type: none"> <li>• 1 (Buy): buy;</li> <li>• 2 (Sell): sell</li> </ul>   |
| 27     | type          | int1          | Order type. Values: <ul style="list-style-type: none"> <li>• 1 (MARKET): market;</li> <li>• 2 (LIMIT): limit;</li> <li>• 101 (ICEBERG): iceberg;</li> <li>• 103 (NEGOTIATED): negotiated</li> </ul> |

Native protocol specification

| Offset | Field               | Datatype                   | Description  |
|--------|---------------------|----------------------------|--|
| 28     | time_in_force       | int1                       | Order time in force. Values: <ul style="list-style-type: none"> <li>• 0 (Day): day;</li> <li>• 1 (GTC): good till cancel;</li> <li>• 2 (OO): opening auction;</li> <li>• 3 (IOC): immediate or cancel;</li> <li>• 4 (FOK): fill or kill;</li> <li>• 6 (GTD): good till date;</li> <li>• 7 (OC): closing auction;</li> <li>• 100 (XH): during the extended trading session</li> </ul> |
| 29     | passive_only        | int1                       | Field reserved for future. Zero byte value.  |
| 30     | auto_cancel         | int1                       | Cancel order on logout/disconnection. Values: <ul style="list-style-type: none"> <li>• 0 (OFF): no cancel;</li> <li>• 1 (AUTO_CANCEL): cancel on logout/disconnection</li> </ul>   |
| 31     | pad                 | int1                       | Field reserved for future. Zero byte value   |
| 32     | routing_instruction | int2                       | Routing order for the remainder  |
| 34     | routing_dest        | int2                       | Liquidity pool ID (for detail refer to section <a href="#">3.8.1.1.1</a> )   |
| 36     | amount              | int4                       | Order amount   |
| 40     | amount_extra        | int4                       | Disclosed amount. To be filled when <code>type=HIDDEN</code> or <code>HIDDEN_DYNAMIC</code>  |
| 44     | price               | dec8                       | Price, or annual percentage yield for repo only  |
| 52     | price_extra         | dec8                       | Extra price. Trade price for repo only   |
| 60     | flags               | int8                       | Order matching parameters. Value: <code>0x2000</code> ( <code>elgnore-DynamicLimits</code> ): ignoring dynamic limits, available only for logins with flag <code>CAN_IGNORE_DYNAMIC_LIMITS</code>  |
| 68     | time_valid          | time8n                     | Deadline for order acceptance  |
| 76     | date_expire         | time4                      | Order expiration timestamp. Zero value   |
| 80     | account             | <a href="#">[account]</a>  | Component specifying client submitted order  |
| 116    | parties             | <a href="#">[otccodes]</a> | Component specifying counterparties  |
| 148    | comment             | char23+1                   | Client comment   |
| 172    | extra_ref           | ascii12                    | Additional order ID  |
| 184    | extra1              | ascii4                     | Field reserved for future. Zero byte value   |

| Offset | Field          | Datatype | Description  |
|--------|----------------|----------|--|
| 188    | prime_exchange | int2     | Main liquidity pool. Values: <ul style="list-style-type: none"> <li>• 0 (DEFAULT): Liquidity pool determined by the trading system;</li> <li>• 1000 (SPB): St Petersburg Exchange/over-the-counter liquidity pool;</li> <li>• 1010 (MOEX_FOND): Moscow Exchange liquidity pool;</li> <li>• 1015 (IB): execution at US markets;</li> <li>• 1030 (NYSE): NYSE;</li> <li>• 1031 (ARCA): ARCA;</li> <li>• 1032 (Nasdaq): NASDAQ;</li> <li>• 1033 (BATS): BATS</li> </ul> |
| 190    | match_ref      | int4     | Optional identifier for negotiated orders matching   |

### 3.8.1.1.1. Routing options

The routing of an order is defined by the combination of the four field values:

1. `routing_dest`, execution type; value [1001](#) (Best Execution at the trading system);
2. `market`, liquidity pools for execution; value [1001](#) (Best Execution at all accessible liquidity pools);
3. `routing_instruction`, a directive for remainder handling; value 0 (passive routing);
4. `prime_exchange`, the liquidity pool that would be the destination for the remainder (for values refer to section [3.5](#)).

### 3.8.1.2. Order cancellation

The client may cancel active remainder of an order by sending the `CancelOrder` message. An order to cancel should be identified with `order_id`. The order originator may either use `orig_clorder_id`. Fields `instrument_id`, `dir`, `type` and `client_id` are also required.

The client should provide the unique identifier `clorder_id` for the command to cancel an order.

Table 23. Identification of order to be canceled

| Action   | Required fields   |
|--|---|
| Canceling of order on request of order originator login                | <code>orig_clorder_id</code> (or <code>order_id</code> ), <code>instrument_id</code> , <code>account</code> , <code>client_id</code> , <code>dir</code> , <code>type</code> |
| Canceling of order on request of login other than the order originator | <code>order_id</code> , <code>instrument_id</code> , <code>account</code> , <code>client_id</code> , <code>dir</code> , <code>type</code>                                   |

After processing a request, the trading system either rejects the message with `RejectReport` or confirms the cancellation with `CancelReport`. If the system rejects a request for cancellation by `order_id`, it will be specified in the `extra_data0` field.

Table 24. Format of message `CancelOrder`: `msgid=112`, `size=100`

| Offset | Field         | Datatype      | Description                             |
|--------|---------------|---------------|---|
|        | [frame]       | [frame]       | Session header                          |
| 0      | [user_header] | [user_header] | Standard header                         |
| 20     | instrument    | [instrument]  | Component specifying trading instrument |

| Offset | Field           | Datatype                  | Description   |
|--------|-----------------|---------------------------|---|
| 26     | dir             | int1                      | Side. Values: <ul style="list-style-type: none"> <li>• 1 (Buy): buy;</li> <li>• 2 (Sell): sell</li> </ul>   |
| 27     | type            | int1                      | Order type. Values: <ul style="list-style-type: none"> <li>• 1 (MARKET): market;</li> <li>• 2 (LIMIT): limit;</li> <li>• 101 (ICEBERG): iceberg;</li> <li>• 103 (NEGOTIATED): negotiated</li> </ul> |
| 28     | order_id        | int8                      | Order ID assigned by the trading system   |
| 36     | account         | <a href="#">[account]</a> | Component specifying client submitted order   |
| 72     | flags           | int8                      | Flags.  |
| 80     | orig_clorder_id | ascii20                   | Client ID of order to cancel  |

### 3.8.1.3. Mass cancellation

The client may mass cancel orders via the `MassCancel` request with the `mode` assumed.

The client should provide the unique identifier `clorder_id` for the command. The value should not start with `onlogout_`.

Value of the `mode` field specifies mass cancel mode. Fields of the `MassCancel` message should be filled according to selected mode.

Table 25. Mass cancel modes

| Value | Mode             | Action  | Applicable fields  |
|-------|------------------|---|--|
| 7     | BY_LOGIN         | Canceling of all orders on request of order originator login                  | <code>clorder_id</code>  |
| 23    | BY_INSTR_LOGIN   | Canceling of all orders of an instrument on request of order originator login | <code>clorder_id</code> , <code>instrument_id</code> , <code>source_id</code>                          |
| 39    | BY_INSTR_ACCOUNT | Canceling of all orders by specifying an instrument and a clearing account    | <code>clorder_id</code> , <code>instrument_id</code> , <code>source_id</code> , <code>account</code>   |
| 55    | BY_INSTR_CLIENT  | Canceling of all orders by specifying an instrument and a client ID           | <code>clorder_id</code> , <code>instrument_id</code> , <code>source_id</code> , <code>client_id</code> |

When applying the `BY_LOGIN` mode, the client should not fill the fields `instrument_id` and `market_id`.

After processing the request, the trading system will confirm each order cancellation with `CancelReport` and will send `MassCancelReport` upon completion.

Table 26. Format of message `MassCancel`: `msgid=103`, `size=63`

| Offset | Field                         | Datatype                      | Description     |
|--------|-------------------------------|-------------------------------|-----------------|
|        | <a href="#">[frame]</a>       | <a href="#">[frame]</a>       | Session header  |
| 0      | <a href="#">[user_header]</a> | <a href="#">[user_header]</a> | Standard header |

| Offset | Field      | Datatype                     | Description   |
|--------|------------|------------------------------|---|
| 20     | instrument | <a href="#">[instrument]</a> | Component specifying trading instrument   |
| 26     | mode       | int1                         | Mass cancel mode. Values: <ul style="list-style-type: none"> <li>• 7 (BY_LOGIN): canceling all orders submitted by the user which is the request originator;</li> <li>• 23 (BY_INSTR_LOGIN): canceling all orders of an instrument submitted by the user which is the request originator;</li> <li>• 39 (BY_INSTR_ACCOUNT): canceling all orders of an instrument and an account;</li> <li>• 55 (BY_INSTR_CLIENT): canceling all orders of an instrument and a client ID</li> </ul> |
| 27     | account    | <a href="#">[account]</a>    | Component specifying trading member, account and client ID  |

### 3.8.1.4. Automatic mass cancellation

At the request of the client, the server can be configured to automatically cancel active orders submitted by a user whenever it disconnects from the server. The user can mark each order through the `auto_cancel` field; whether it should be automatically canceled, should a disconnection or logout happen. For each order `CancelReport` is generated with the `reason` field stamped with `DISCONNECT`.

Upon reconnection, the user will receive `MassCancelReport` with the `clorder_id` starting with `onlogout_`.

### 3.8.1.5. Counterorder declination

The client may decline a counterorder via `CounterDecline` that should contains `clorder_id` assigned by the order originator, the counterparties identifiers `initiator_party` and `ctrparty_id`, and, if filled in the original order, the `match_ref`.

After processing the request, the trading system will confirm order cancellation with `CounterDeclineReport` or will reject it with `RejectReport`.

Table 27. Format of message `CounterDecline`: msgid=105, size=72

| Offset | Field         | Datatype                      | Description   |
|--------|---------------|-------------------------------|---|

| 27     | type          | int1                          | Order type. Values: <ul style="list-style-type: none"> <li>• 1 (MARKET): market;</li> <li>• 2 (LIMIT): limit;</li> <li>• 101 (ICEBERG): iceberg;</li> <li>• 103 (NEGOTIATED): negotiated</li> </ul> |
| 28     | parties       | <a href="#">[otccodes]</a>    | Component specifying counterparties   |

| Offset | Field     | Datatype | Description                               |
|--------|-----------|----------|---|
| 60     | order_id  | int8     | Order ID assigned by the trading system   |
| 68     | match_ref | int4     | Identifier for negotiated orders matching |

## 3.8.2. Reports

### 3.8.2.1. Rejection report

The trading system rejects an application request with `RejectReport` message in the following cases:

- Request does not correspond to the Login permission.
- Request contains an invalid value.
- Request cannot be processed (for example, due to a closed market).

The `reason` will be specified in `RejectReport` and the `message` field will have a textual description or rejection parameters.

Table 28. Format of message `RejectReport`: msgid=201, size=91

| Offset | Field         | Datatype      | Description   |
|--------|---------------|---------------|---|
|        | [frame]       | [frame]       | Session header  |
| 0      | [gate_header] | [gate_header] | Standard header   |
| 46     | market        | int2          | Liquidity pool rejecting client's order                         |
| 48     | reason        | int2          | Code of rejection reason  |
| 50     | message       | char32+1      | Rejection code parameters and or its textual description        |
| 83     | extra_data0   | int8          | Order ID, when instruction to cancel was identified by order_id |

### 3.8.2.2. Addition report

When the client's order is successfully accepted, the trading system sends the `AddReport` with a `order_id` unique across a trading session, a client order ID `clorder_id` and all order parameters.

The negotiated order report also contains the counterparties identifiers `initiator_party` and `ctrparty_id`, and the code for order matching `match_ref`.

The trading system routes orders to liquidity pools and then expects a reply. If a liquidity pool accepts an order, the client will be sent `AddReport` with the `exch_orderid`. If a liquidity pool rejected an order, the trading system will generate `RejectReport`.

Table 29. Format of message `AddReport`: msgid=212, size=260

| Offset | Field         | Datatype      | Description   |
|--------|---------------|---------------|---|

### 3.8.2.3. New counterorder report

When the client's negotiated order is successfully accepted, the trading system notifies the counterparty's user with CounterReport. The report contains a client order ID `clorder_id`, a counterparty IDs `initiator_party` and `ctrparty_id`, and all order parameters.

Table 30. Format of message CounterReport: msgid=203, size=122

| Offset | Field         | Datatype      | Description   |

| Offset | Field    | Datatype                   | Description   |
|--------|----------|----------------------------|---|
| 74     | flags    | int8                       | <p>Order matching parameters. Values:</p> <ul style="list-style-type: none"> <li>• 0x1 (eUserLastRec): last transaction message: last report on trades executed within a single transaction;</li> <li>• 0x2 (eMMObligations): indicator of market maker executing the obligations at internal exchange, to be assigned to visible limit orders;</li> <li>• 0x4 (eNoMMTrade): indicator of order by market maker that not to be matched with another market maker's order;</li> <li>• 0x8 (ePresettlement): pre-delivery trade;</li> <li>• 0x10 (eExternalActivity): transaction executed through external interfaces;</li> <li>• 0x20 (eDelivery): delivery trade;</li> <li>• 0x40 (eDeliverySwapGood): transfer of a bona fide participant during delivery;</li> <li>• 0x80 (eDeliverySwapBad): transfer of a mala fide participant during delivery;</li> <li>• 0x100 (eDeliveryDonorTrade): delivery transfer of participant with donor involvement;</li> <li>• 0x200 (eNoSystem): negotiated trade indicator;</li> <li>• 0x2000 (eIgnoreDynamicLimits): ignoring dynamic limits;</li> <li>• 0x40000 (eLimitedMargin): a sign of limited security;</li> <li>• 0x100000 (eClientPartialExecute): partial execution of address order sent by the client;</li> <li>• 0x200000 (eHaltPeriodOrder): marker of issuing an order during a suspension period;</li> <li>• 0x400000 (eOverTheCounter): marker of an order or a deal with over-the-counter instrument</li> </ul> |
| 82     | parties  | <a href="#">[otccodes]</a> | Component specifying counterparties   |
| 114    | order_id | int8                       | Order ID assigned by the trading system   |

### 3.8.2.4. Execution report

When a trade matching is done, the trading system will send the `Execution` report to the client. A report contains details of one or more trades made at the same liquidity pool specified in the `exec_market` field (for values refer to section 3.5).

Trade details (price, amount, and identifier unique across a trading day) are listed in the `deals` group. The number of entries (i.e. number of trades being reported) is specified in the `deals_count` field. The size of the `Execution` message is dynamic and depends on the number of `deals` entries (on processing such messages refer to section 3.6).

Table 31. Format of message `Execution`: msgid=207, dynamic length

| Offset | Field                         | Datatype                      | Description                             |

|        | > deals      | <a href="#">[deal]</a>     | Trade information   |

### 3.8.2.5. Cancellation report

When an order is successfully canceled, the trading system will send `CancelReport`. The report contains order parameters, order IDs `order_id` and `orig_clorder_id`, and reason of cancellation in the `reason` field.

When an Immediate Or Cancel order is partially filled, the liquidity pool will cancel the order remainder and the client will receive `CancelReport` with value `EXPIRED_NOTRADES` in the `reason` field.

A liquidity pool can cancel an order remainder to prevent a cross trade and then in the `reason` field will be set to value `EXPIRED_CROSSTRADE`.

An liquidity pool can cancel an active order to avoid a crossed order book and then in the `reason` field will be set to value `EXPIRED_ORDERBOOK_CROSS`.

Table 32. Format of message `CancelReport`: `msgid=214`, `size=172`

| Offset | Field                      | Datatype                      | Description  |

### 3.8.2.6. Mass cancellation report

The trading system will respond to the `MassCancel` request with `MassCancelReport`. The completion is specified in the `cancel_status` field.

If the request resulted in one or more orders cancellation, the trading system will send each order's `CancelReport` before the `MassCancelReport`.

### 3.8.2.8. Counterorder declination report

After a counter order successfully declined, the trading system will send `CounterDeclineReport` to the client. The report contains order parameters, order IDs `order_id` and `clorder_id`, counterparty IDs `initiator_party` and `ctrparty_id`.

Native protocol specification
